### Current Status of the Population in Captivity

The data reported in this studbook are current through March 15 2013. As of that date, the historical population was 284.334.117 (735) animals and the living population was 37.48.0 (85) animals in 32 institutions. This number includes:

- 53 (25.28.0) birds in 20 institutions in United States and Mexico. This population is managed as a Species Survival Plan (SSP) under the auspices of AZA (Association of Zoos and Aquariums)
- 3 (1.2) birds in 2 institutions in the African region
- 13 (3.10) birds in 6 institutions in the European region
- 16 birds (8.8) in 4 institutions in the Middle East region

### Current status of the wild population

Despite popular references that list the kori bustard *Ardeotis kori* as "common and abundant", no surveys have been conducted to determine the species population status in nature. Due to a complex combination of poorly understood factors, kori bustards are declining throughout their natural range in eastern and southern Africa. Furthermore, recent reports have noted that kori bustard numbers have declined markedly as revealed by the complete absence of birds from areas where they were previously and commonly found. Reasons for species decline include bush encroachment, illegal hunting, a low tolerance of human activity, an inherently low reproductive rate and reduced breeding in drought years. Kori bustards are now listed as 'vulnerable' in South Africa by the *Red Data Book of Birds of South Africa, Lesotho and Swaziland*. Recent population surveys in Botswana indicate that the species is rapidly declining. Because there will continue to be inevitable human population increase and habitat loss in Africa, kori bustard populations can be expected to decline further. In addition to lack of information on animal numbers in the wild, very little is known about species movements or migratory patterns, general biology or ecology.

### IUCN Red List of Threatened Species

#### Population:

The global population size has not been quantified, but the species is reported to be still common where undisturbed (del Hoyo et al. 1996).

#### Population Trend:

 Decreasing

## 2013 International Studbook for the Kori Bustard Ardeotis kori

BirdLife International 2012. *Ardeotis kori*. In: IUCN 2012. IUCN Red List of Threatened Species. Version 2012.2. <[www.iucnredlist.org](http://www.iucnredlist.org)>. Downloaded on **25 March 2013**.

### **Zoos that contributed data to the current population**

The following zoos contributed to the 2013 studbook (by ISIS mnemonic): AL AIN, ATLANTA, AUDUBON, BIRMINGHM, CAMBRON, COLO SPRG, DALLAS, DENVER, DUISBURG, FORTWORTH, FRANKLINP, JACKSONVL, JOHANSBRG, KANSASCTY, KREFELD, MAKTOUM, METROZOO, NZP-WASH, NURNBERG, PALM DES, PHOENIX, PUEBLA, SAFA WILD, SD-WAP, SEDGWICK, TOLEDO, TUCSON, UMGEDI PK, WACO, WALSRODE

### **Zoos that did not contribute data to the current population**

The following zoos did not contribute to the 2013 studbook (by ISIS mnemonic): SCHMIDING, NARC, ROMA

### **Acknowledgments**

### **History of the Studbook**

The formation of the North American Regional Studbook for kori bustards was approved by WCMC (Wildlife Conservation and Management Committee) in 1993. WCMC operates under AZA (Association of Zoos and Aquariums). The conversion of this studbook to an International level was approved initially by WCMC (Wildlife Conservation and Management Committee) in December 1995, and finally by the World Conservation Union/Species Survival Commission (IUCN/SSC) and the International Union of Directors of Zoological Gardens- the World Zoo Organization (IUDZG-WZO) in May 1996.

Captive born offspring from wild caught birds, of which the capture location for both parents is known, have a subspecies designation as well. Hatch dates for wild caught birds are estimated to the year, unless institutions have provided information otherwise. The hatch date for wild caught birds is based on the year the bird arrived in a facility. It was assumed that young birds (1-2 years) were captured for institutions. The assumption was also made that the dealer involved did not hold the bird for an extended period of time. Thus, the hatch date for wild caught birds is generally one year before the bird was captured, unless a facility has provided information to the contrary. Dates listed for transfers to dealers are also estimated. The assumption was made that a lack of long term holding facilities in the place of capture led to the dealer not holding the bird for an extended period of time. Thus, dates for transfers from dealers to institutions are generally the same year the bird arrived into a particular facility. The abbreviation MULT is used when there is more than one possible dam or sire.

## STUDBOOK FORMAT

The Kori Bustard Studbook uses the Single Population Animal Record Keeping System (SPARKS) program, version 1.54

*STUD #:* Bird's permanent studbook number. Each institution should enter the studbook number into ARKS for all animals that they have held.

*SEX:* M= male      F= female      U= unknown

*HATCH DATE:* Bird's hatch date. A tilde mark ‘~’ before the date indicates an approximate date. ‘?’ indicates that the hatch date is unknown.

*SIRE and DAM:* Studbook numbers for the bird's sire and dam. ‘Unk’ indicates that either or both are unknown. ‘Mult’ indicates that there are several possible sires and/or dams.

*LOCATION:* The facility that has acquired the bird. An alphabetical listing of current holding locations as well as all historic holding sites including addresses is included at the end of the studbook. If a bird is no longer traceable, ‘ltf’ (lost to follow up) will appear to the right of the last known location.

*DATE:* The date on which the bird arrived or left a facility. A tilde ‘~’ mark indicates that the arrival date is approximate. ‘Unk’ indicates that the date is unknown.

*LOCAL ID:* The facilities local identification number (often the ISIS number as well).

*EVENT:* Capture, Birth, Transfer (physical move with corresponding ownership change), Loan (physical move with no ownership change), Death.

*REARING:* Indicates whether the bird was parent or handreared, or if rearing method is unknown.

## NATURAL HISTORY

*Natural History Information is taken from: AZA Gruiformes TAG 2009. Kori Bustard (Ardeotis kori) Care Manual. Association of Zoos and Aquariums, Silver Spring, MD. pp.113.*

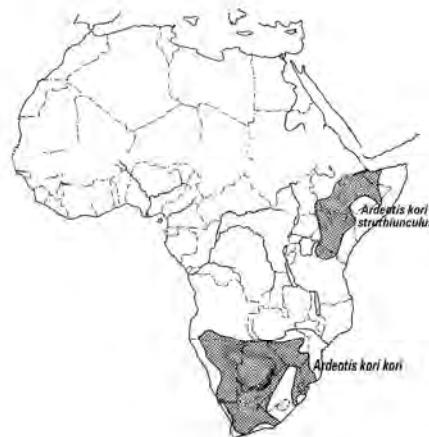

*PDF copies of this manual are available upon request from Sara Hallager, [hallagers@si.edu](mailto:hallagers@si.edu)*

**Natural History:** Kori bustards are large, terrestrial, omnivorous birds that inhabit open plains and semi-desert areas within their natural habitats (Bailey et al. 1997a). Kori bustards are indigenous to the grasslands and lightly wooded savannas of southern and eastern Africa (Hallager and Boylan 2004). *A. k. kori* can be found in Botswana, Zimbabwe, Namibia, southern Angola, South Africa and Mozambique (Johnsgard 1991). In eastern Africa, *A. k. struthiunculus* can be found in Ethiopia, Uganda, Sudan, Kenya, and Tanzania (del Hoyo et al. 1996). Natural predators of kori bustards in these environments include black-backed jackal (*Canis mesomelas*), spotted hyena (*Crocuta crocuta*), martial eagle (*Polemaetus bellicosus*), tawny eagle (*Aquila rapax*), Verreaux's eagle (*Aquila verreauxii*), leopard (*Panthera pardus*), lion (*Panthera leo*), and caracal (*Caracal caracal*) (Hallager and Boylan 2004).

Kori bustards are omnivorous, and have been observed consuming flowers, leaves, seeds, fruits, pods, acacia gum, insect prey (e.g., Hymenoptera, Orthoptera, Coleoptera, Lepidoptera), and non-insect prey (e.g., Chilopoda, Diplopoda, Annelida, and Reptilia) (Mwangi 1988; Osborne 1998). When drinking from water sources, kori bustards use an unusual sucking action (Hallager 1994), which may be an adaptation to arid climates where water can be limited (Hallager and Boylan 2004).

The daily activity of wild kori bustards involves periods of activity in the morning and evening (0900 and 1700), with birds awaking 30 minutes before sunrise to begin feeding, and periods of rest during the heat of the day (1130-1530) (Mwangi and Karanja 1993; Osborne 1998). Preening and dustbathing were observed to occur most frequently during the middle of the day (Mwangi 1988). During the breeding season, males also spend time performing courtship displays during the early morning and late afternoon/evening periods (Hallager and Boylan 2004). Kori bustards spend much of their time on the ground, generally moving about in a slow walk; running and flying are performed to escape from danger (Mwangi 1988).

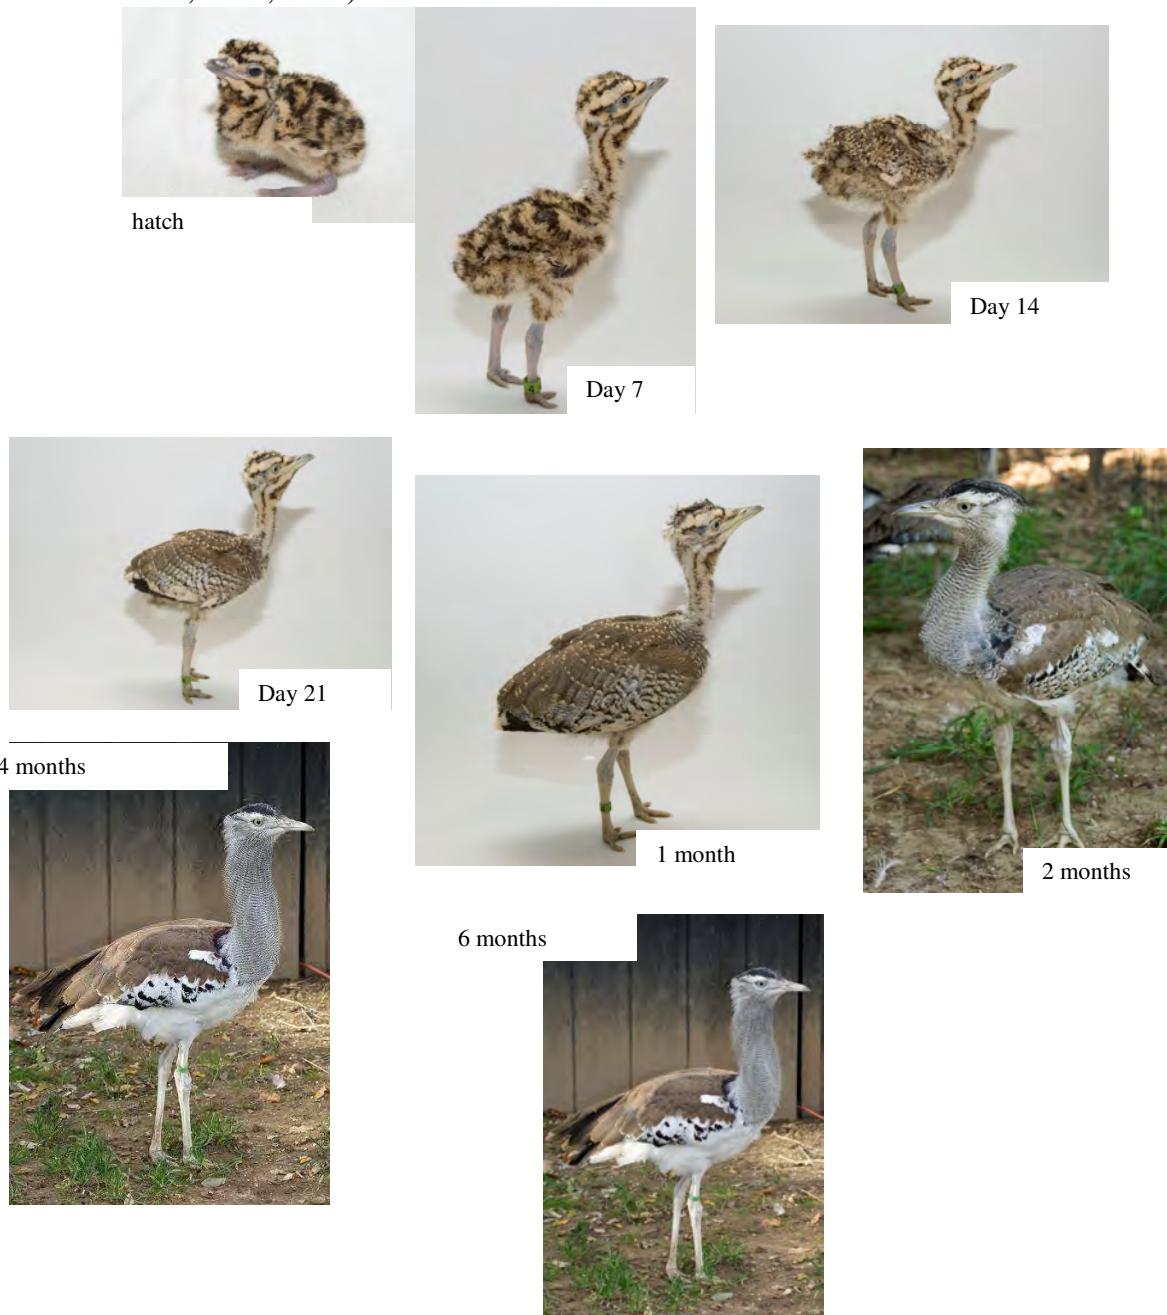

In the wild, kori bustards have a lek-like breeding system, where males gather either singly or in loose lek-like formations during the breeding season and perform "balloon" displays to attract females (Hallager and Boylan 2004). During a male's display, the esophagus can be inflated up to four times its normal size, and with the neck expanded, the tail and wing feathers pointed downward, and the crest erected, the male emits a low-pitched six-note booming vocalization as he snaps his bill open and shut (Hallager and Boylan 2004).

## 2013 International Studbook for the Kori Bustard Ardeotis kori

Prior to copulation, males often spend 5-10 minutes pecking the head of the recumbent females; copulation itself lasts no more than a few seconds (Hallager and Boylan 2004). Males play no role in egg or chick care, and continue to display to other females after copulation; males do not associate with females outside of breeding interactions (Hallager and Boylan 2004).

The chicks of kori bustards are precocial, have open eyes at hatching, and are able to stand within hours (Bailey et al. 1997b). Average brood size of wild birds is 1.52 chicks (Osborne and Osborne 1998). Females are thought to feed newly hatched young with insects as the primary food item. Chicks remain with the dam until the start of the next breeding season, when they disperse (Hallager and Boylan 2004). Adult and sub-adult males have been found to disperse widely (up to 120km) following the breeding season, while juvenile females were found to emigrate only 2-5km from their natal areas (Osborne and Osborne 1998, 1999, 2000).

**Physical Description:** The following information on the physical appearance of kori bustards has been adapted in part from Johnsgard (1991). The table below provides ranges for kori bustard size and weight parameters.

Size and weight parameters for *A. k. struthiunculus* (adapted from Johnsgard 1991)

	Male	Female
Weight	22-33.1lb (10-15kg)	12.1-15.4 (5.5-7kg)
Breeding season weight	33.1- 41.9lb (15-19kg)	---
Tail	14.6-15.2" (370-387mm)	11-13.5" (280-342mm)
Wingspan	29.6-30.2" (752-767mm)	23.6-25.8" (600-655mm)
Culmen	3.7-4.7" (95-120mm)	3.2-3.7" (81-95mm)
Tarsus	9.1-9.7" (230-247mm)	7.1-8.1" (181-205mm)

**Adult male:** Kori bustards show size-based sexual dimorphism, with adult males being larger than females; the weight of adult males ranges from 15.4-30.9lb (7-14kg), while adult females usually weigh less than 15.4lb (7kg) (Bailey and Hallager 2003). Sub-adult males are similar in size to adult males but have a thinner neck (Osborne and Osborne 2001). During the breeding season, male kori bustards (*A.k.struthiunculus*) have a darkened throat patch, which becomes less black following post-breeding molt. Plumage coloration is generally similar between the sexes.

**Adult female:** Adult females are smaller than males, approximately 3-6kg (Bailey and Hallager 2003), with the black on the crown and with the eye stripe somewhat reduced (Urban et al. 1986). Juvenile females have a slighter appearance with a slimmer bill, thinner legs, and a brownish back (Osborne and Osborne 2001). The table below provides a general description of male and female coloration.

Coloration of kori bustards (adapted from Johnsgard 1991; Hallager and Boylan 2004)

Body Part	Coloration
General coloration (back)	Dark sandy brown, with blackish vermiculations, and with a slight grayish shade
Mantle and upper back feathers	As above, but generally more blackish
Lower back, rump, and upper tail coverts	Similar to back, but upper tail coverts are rather more coarsely freckled
Lesser wing coverts	Similar to back
Median coverts	Mostly white, coarsely mottled with black or grey freckles, with a broad black subterminal bar and a white tip
Greater coverts	Similar to median coverts, but more thickly mottled

2013 International Studbook for the Kori Bustard *Ardeotis kori*

<b>Body Part</b>	<b>Coloration</b>
	with black or grey vermiculations
Alula	Similar to median or greater coverts, but subterminal bar not so strongly indicated
Primary coverts	Ashy brown, with the inner ones mottled and broadly tipped with white
Remiges	Brown, with two outer ones scarcely freckled with white on the outer web, but inner ones becoming more white on the inner web, barred with bluish grey, and tipped with white
Inner primaries	Some are checkered with sandy buff on the outer webs
Secondaries	Bluish-gray, mottled with white, with a white tip, and a subterminal bar of blackish-brown; the innermost secondaries are like the back
Rectrices	Ashy brown at base, crossed by two broad bands of white, separated from each other by black bands, one broad and one narrow, the latter band is followed by an indistinct white band which merges into the sandy brown ending of the tail. This portion has a narrow band of black, a broader subterminal band of black, and a white tip
Crown	Strongly crested, black, with a grayish band of feathers down the center, and a black post-ocular stripe (stripe reduced or lacking in <i>A. k. kori</i> ).
Nape and sides of posterior crown	Grayish white and barred with black, exactly like the neck
Sides of face, throat, streak over eye, patch in front of eye, anterior cheeks, and chin	White
Foreneck	A crescentic band of black is partly concealed by the long barred feathers of the lower throat
Sides of the upper breast	Marked with black
Axillaries and under wing coverts	White
Lower primary coverts	Ashy freckled with white
Iris	Lemon yellow to orange brown
Bill	Light horn color, darker brown above and yellowish below
Tarsi and toes	Light yellowish

**Conservation Issues:** Kori bustards are listed in Appendix II of the Convention on International Trade in Endangered Species (CITES). The southern race, *Ardeotis kori kori*, is listed as Vulnerable in the South African Red Data Book (Brooke 1984), as well as the Eskom Red Data Book of Birds of South Africa, Lesotho, and Swaziland (Barnes 2000). The kori bustard population in the United States is managed as a Species Survival Plan® (SSP).

The main threats to wild kori bustards are in the form of human-induced factors, and include habitat destruction through increasing agricultural development (Dale 1990; Ottichilo et al. 2001), bush encroachment caused by over-grazing from livestock, hunting for the bushmeat trade, and trapping for private collections in the Gulf States. Poison used to control locusts is generally toxic to birds, and may also be affecting kori bustard populations (Barnes 2000). Although the kori bustard is listed as “protected game,” it continues to be hunted over much of its range. In Namibia, it is commonly referred to as the “Christmas turkey” (Osborne and Osborne 2001), and in South Africa it is called the “Kalahari Kentucky” (Barnes 2000). In general, the greatest numbers of kori bustards in southern Africa can be found in protected areas, where they are 45 times more likely to be seen in protected areas than in unprotected areas (Herremans 1998).

Collisions with overhead power lines are also a serious problem for kori bustards (Martin, G.R. 2010), with one 6 mile (10km) stretch of overhead power lines in the Karoo (South Africa) leading to the death of 22 kori bustards during a 5-month period (Van Rooyen 2000). Very little is currently known about natural health and disease issues affecting wild kori bustards, or how their health status relates to declining populations. Recent studies have begun to collect such valuable baseline information on free ranging kori bustards (Murray, S. et.al in prep).

Natural factors affecting populations of kori bustards in the wild include an inherent low reproductive rate and reduced breeding activity in dry years, despite a constant predation pressure. In addition, favored areas such as tree-lined watercourses are becoming unsuitable for kori bustards because they are being invaded by alien plant species (Barnes 2000).

Since the late nineteenth century, range-size has contracted, by 21% in East Africa and 8% in southern Africa. There is strong qualitative evidence of considerable pre- and post-1970 population declines in all range states, except Zambia (slight increase) and Angola (trend unclear). In some countries declines occurred from the early 1900s. Thus, while relatively modest change in range-size has occurred in over 100 years, numbers have greatly reduced throughout the species’s range [Senyatso, K. et.al 2012].

**Present range of *Ardeotis kori struthiunculus*:** The present range of this subspecies is smaller than in previous times. In Ethiopia, the species is now found only south of 9° latitude. From there, the range extends west to the extreme southeastern part of Sudan and south to western Kenya and northeastern Uganda. There are no records of birds in Somalia since 1970. In Tanzania, it is restricted to the northern plains (P. Goriup, personal communication; N. Baker, personal communication). They are scarce around the coastal lowlands of Tanzania and Kenya (Zimmerman 1996).

**Historical distribution of *Ardeotis kori struthiunculus*:** The subspecies historically ranged throughout most of Ethiopia (Ash 1989) and southeastern Sudan (below 9° latitude). The subspecies also ranged southeast to northwestern Somalia, and west and south to northern Uganda, Kenya, and the highlands north of the Singida providence in Tanzania.

Present range of *Ardeotis kori kori*: The present range of this subspecies is also smaller than in previous times. It is now distributed in the semi-arid areas in the western half of southern Africa, including Namibia, extreme southern Angola (rarely), western Zambia, Botswana, western Zimbabwe, South Africa, and the Limpopo Valley of Mozambique.

In South Africa, it is found mainly in the Transvaal lowveld and the northern Cape Province, as well as the Kruger and Kalahari Gemsbok National Parks (Kemp 1980), although it is very scarce along the eastern border of Kruger National Park near Mozambique (Barnes 2000). *A. k. kori* is a vagrant in Lesotho (P. Goriup, personal communication). Allan (1988) reported that the subspecies has declined in the Transvaal, Orange Free State, and parts of Cape Province; Parker (1994) noted that this subspecies went extinct in Swaziland prior to 1960.

Historical distribution of *Ardeotis kori kori*: This southern subspecies historically ranged throughout most of southern Africa, including Zimbabwe, Botswana, southern Angola, Namibia, South Africa, southern Mozambique (Johnsgard 1991) and Swaziland (Harrison et al. 1997).

Population: Throughout its range, the species (including both subspecies) is uncommon to locally common, but generally declining (Urban et al. 1986). The habitat of both subspecies is under threat from the spread of agriculture, high human densities, illegal hunting, over grazing by livestock, and bush encroachment. According to del Hoyo et al. (1996), the kori bustard is showing signs of chronic decline and local extinction over its entire range. Total population size has not been reported for either subspecies.

The entire East African region is currently undergoing widespread ecological changes as a result of increased agricultural practices and other forms of land use (Mwangi 1988). Since 1950, the area of land used for agriculture has increased by 26% (Happold 1995). Lado (1996) states that habitat destruction and/or alteration the most serious threat to the future of wildlife in Kenya. As an example, the area used for wheat production in the Masai Mara has grown from 4875ha in 1975 to over 50,000ha in 1995. In the nearby Loita plains (where kori bustards are known to frequent), wheat production continues to expand as the human population grows, and as farmers realize the agricultural potential of the land. As areas used for agriculture expand in Kenya, it can be expected that the numbers of wildlife, including kori bustards, will decline (Ottichilo et al. 2001).

The spread of agriculture, urbanization, pollution, pesticides (including those that are banned in other countries), and other consequences of an exploding human population, are all contributing to a deteriorating situation for many species of wildlife, including kori bustards.

The following table provides information on the conservation status of kori bustards in range countries.

Status of *Ardeotis kori struthiunculus* and *Ardeotis kori kori* in range countries

Country	Population Size/Status
<i>Ardeotis kori struthiunculus</i>	
Sudan	Breeding populations exist in the extreme southeastern area of the country, but

Country	Population Size/Status
	total population size is unknown. Kori bustards may be only a dry season visitor to this country (Nikolaus 1987).
Kenya	Kori bustards are most numerous in the dry grassland areas of northern and western Kenya, and in the Rift Valley highlands south to Mara Game Reserve, Loita Plains, Nairobi National Park, and Amboseli National Park. They are scarce and localized from the Tana River south to Tsavo West and Tsavo East National Park (Zimmerman 1996). Total population size is unknown. Mwangi (1988) estimated 0.3 birds per km <sup>2</sup> in Nairobi National Park in 1986/87.
Uganda	Breeding populations exist in Acholi, Lango, and Kidepo National Park. Total population size is unknown.
Ethiopia	Kori bustards were formally common in Ethiopia south of 9° latitude, but numbers have declined (P. Goriup, personal communication). Total population size is unknown.
Somalia	There are no records of birds in Somalia since 1970.
Tanzania	The Serengeti National Park, Ngorongoro Conservation Area, Tarangire National Park, Maswa Game Reserve, Arusha National Park, and Mkomazi Game Reserve offer long-term protection to kori bustards, and viable populations of birds can be found in these protected areas. Kori bustards are still relatively common in the Rift Valley highlands. There is a small and isolated population in central Tanzania, which occupies a small area at low densities (N. Baker, personal communication). This subspecies is regarded as scarce around the coast (Zimmerman 1996). The birds are hunted around the Lake Eyasi Basin, Lake Natron, and in the foothills of Mt. Kilimnajaro (N. Baker, personal communication). Total population size is unknown.
<i>Ardeotis kori kori</i>	
Botswana	Despite low human densities, kori bustards in Botswana are under severe pressure from habitat loss. Nonetheless, strongholds for the species include the Kalahari Gemsbok National Park (with an estimated population size of 100-140 birds – Barnes 2000), Central Kalahari Game Reserve, Nxai Pan National Park, and the Chobe National Park, where road counts found 1 bird/106km. However, in unprotected areas, the density level dropped to 1 bird/4356km (Harrison et al. 1997). Suitable habitat for kori bustards has been lost due to grazing by livestock (Herremans 1998), which has increased dramatically over the past 100 years. Livestock numbers continue to grow despite reports of overgrazing and forecasts of devastating long-term land degradation since the early 1970's. Total population size of kori bustards is unknown.  <b>Kori Bustard Conservation Concern Citation: “The Status of globally and Nationally Threatened Birds in Botswana 2008</b> <u>Status and distribution</u> Botswana is the stronghold of the Kori Bustard in Southern Africa; elsewhere

Country	Population Size/Status
	<p>in the region it has apparently decreased markedly outside protected areas. It is currently widespread in Botswana, but the key areas where it is abundant – Savuti, Nxai Pan, the Nossob Valley and Deception Valley – are within national parks and game reserves. Tyler (2005) suggested that Kori Bustards in Botswana have retreated into protected areas.</p> <p><u>Ongoing monitoring</u></p> <p>A detailed PhD study of the Kori Bustard, entitled “Ecology and conservation of the Kori Bustard <i>Ardeotis kori</i> in Botswana” is being undertaken at present to ensure that the population in Botswana is secure; it will produce recommendations for the long-term conservation of the species.</p> <p><u>Threats</u></p> <p>The documented threats to the species are habitat destruction (through transformation of formerly suitable areas to crop farming, and/or bush encroachment due to rangeland overgrazing), hunting pressure, human disturbance, collision with overhead transmission lines, poisoning, stray dogs and entanglement in fences – of these, illegal hunting in Botswana is definitely important (Senyatso, 2006).</p> <p><u>Conservation action</u></p> <p>Apart from the applied research being undertaken (as described above), there was no conservation action undertaken for this species during 2008.</p> <p><u>Priorities for 2009 and beyond</u></p> <p>It is important to establish quantifiable, measurable trends for this species both inside and outside protected areas, and to ascertain which of the general threats mentioned above are operative in Botswana, so that if the species is at risk, a Species Action Plan can be developed. These issues will emerge from the ongoing PhD study, so that conservation action could be undertaken if necessary. In the short-term, it may be constructive to repeat Ritter’s unpublished Kori Bustard counts from Nxai Pan from the early 1990s. Due to the existence of these historical data, it will be possible to get an indication of whether or not this sub-population (which is protected) has increased, remained stable or decreased – it can then serve as a benchmark for other subpopulations.</p>
Namibia	The stronghold for kori bustards in Namibia and possibly the world is in Etosha National Park, where Osborne and Osborne (1998) found 1 bird/16km. Outside the park boundaries however, birds are hunted.
Zimbabwe	Suitable habitat for kori bustards is deteriorating through overgrazing by livestock, and the situation is similar to Botswana. Matabeleland is the stronghold for the species in Zimbabwe (Rockingham-Gill 1983). The species has decreased in several areas, most noticeably in the Mashonaland plateau (Harrison et al. 1997), where birds are hunted. The decline in this area was first noticed in the 1920’s (Irwin 1981). Total population size has been variously reported in 1980, when an estimation of 10,700 birds was given by Rockingham-Gill (1983), although Dale (1990) reported 5000 birds, and Mundy (1989) estimated 2000 birds, and states that Rockingham-Gill’s 1983

2013 International Studbook for the Kori Bustard *Ardeotis kori*

<b>Country</b>	<b>Population Size/Status</b>
	estimate is vastly over estimated. Total population size is unknown.
South Africa	Numbers declined in the 20 <sup>th</sup> century, but the extent of the decline is unknown (Brooke 1984). Kruger National Park supports 100-250 individuals (Barnes 2000). Outside protected areas, kori bustards are found in relatively large numbers only in the Platberg-Karoo Conservancy in South Africa (Barnes 2000). Allan (1988) reported that the species has declined in the Transvaal, Orange Free State (where it is uncommon to rare), and in parts of Cape Province. Total population size is estimated to be between 2000-5000 birds.
Mozambique	The kori bustard population is locally threatened (hunting is the greatest threat), and probably numbers less than 100 birds (Parker 1999).
Other	Parker (1994) noted that this subspecies went extinct in Swaziland prior to 1960. In Angola, the species is a rare visitor. In Zambia, kori bustards are found only west of the Zambezi River, although their status there is unclear. The Sioma Ngwezi National Park may offer some protection. This subspecies is considered very sparse in Natal with one sighting reported in 1976 (Cyrus and Robson 1980).

## REPRODUCTIVE PARAMETERS ♀ ♀ FEMALE REPRODUCTIVE DATA

Youngest dams at first reproduction:

625 at NARC had baby 696 at age 1Y,11M,30D  
 371 at PHOENIX had baby 533 at age 3Y,0M,5D  
 290 at NARC had baby 500 (d<30 days) at age 3Y,7M,16D  
 284 at NARC had baby 507 at age 3Y,9M,7D  
 272 at NARC had baby 470 at age 3Y,11M,25D  
 251 at NARC had baby 449 at age 4Y,2M,8D  
 273 at NARC had baby 493 at age 4Y,6M,11D  
 448 at WACO had baby 619 (d<30 days) at age 5Y,5M,20D  
 206 at NARC had baby 287 at age ~5Y,7M,17D  
 321 at NURNBERG had baby 333 at age ~6Y

Oldest dams at first reproduction:

115 at NZP-WASH had baby 656 at age ~22Y  
 99 at SD-WAP had baby 575 at age ~18Y  
 87 at STCATHERN had baby 542 at age ~18Y  
 322 at NURNBERG had baby 698 at age 16Y,11M,14D  
 57 at DALLAS had baby 148 at age ~16Y  
 317 at NURNBERG had baby 334 (d<30 days) at age ~16Y  
 78 at PHOENIX had baby 193 at age ~14Y  
 80 at PHOENIX had baby 192 at age ~13Y  
 131 at DALLAS had baby 429 at age ~13Y  
 119 at NZP-WASH had baby 356 at age ~12Y

Oldest dams to have reproduced:

57 at DALLAS had baby 616 (d<30 days) at age ~28Y  
 57 at DALLAS had baby 641 (stillb/prem) at age ~28Y  
 99 at SD-WAP had baby 715 at age ~27Y  
 99 at SD-WAP had baby 700 at age ~26Y  
 131 at DALLAS had baby 689 at age ~23Y  
 57 at DALLAS had baby 428 at age ~23Y  
 131 at DALLAS had baby 679 at age ~22Y  
 115 at NZP-WASH had baby 656 at age ~22Y  
 57 at DALLAS had baby 397 at age ~22Y  
 131 at DALLAS had baby 674 (d<30 days) at age ~22Y

	FEMALES	Median	Average	N

## FEMALE AGE DATA

Oldest females:

402	Wild hatched	Died at KREFELD/V1653 at age of ~31Y In captivity for ~30Y
78	Wild hatched	Died at METROZOO/B50373 at age of ~30Y In captivity for ~28Y
87	Wild hatched	Died at NZP-WASH/215349 at age of ~28Y In captivity for ~27Y
115	Wild hatched	Died at NZP-WASH/215326 at age of ~26Y In captivity for ~24Y
139	Wild hatched	Died at METROZOO/B30080 at age of ~26Y In captivity for ~24Y
131	Wild hatched	Died at DALLAS/948952 at age of ~26Y In captivity for ~25Y
46	Wild hatched	Died at NZP-WASH/213812 at age of ~25Y In captivity for ~20Y
108	Wild hatched	Died at SD-WAP/387166 at age of ~24Y In captivity for ~22Y
95	Wild hatched	Died at NZP-WASH/209207 at age of ~24Y In captivity for ~22Y
136	Wild hatched	Died at DALLAS/886438 at age of ~23Y In captivity for ~21Y

Oldest living females:

57	Wild hatched	At DALLAS/002024 at age of ~37Y In captivity for ~33Y
99	Wild hatched	At SD-WAP/029555 at age of ~29Y In captivity for ~27Y
358	Wild hatched	At ROMA/1431 at age of ~24Y In captivity for ~21Y
557	Wild hatched	At MAKTOUM/97B233 at age of ~22Y In captivity for 15Y, 9M, 1D
703	Unk hatch type	At SCHMIDING/930203 at age of ~20Y In captivity for ~17Y, 5M
251	Captive hatched	At NARC/708 at age of 18Y, 3M, 25D
395	Wild hatched	At SD-WAP/898317 at age of ~17Y In captivity for 14Y, 9M, 9D
389	Wild hatched	At NZP-WASH/214097 at age of ~16Y In captivity for ~14Y, 9M, 9D
286	Captive hatched	At DUISBURG/3960 at age of 16Y, 6M, 6D
420	Wild hatched	At JOHANSBRG/3596 at age of ~16Y In captivity for ~14Y, 7M

## 2013 International Studbook for the Kori Bustard Ardeotis kori

### Oldest unknown sex:

11	Wild hatched	Died at NZP-WASH/31849 at age of ~14Y In captivity for ~12Y
7	Wild hatched	Died at NZP-WASH/28751 at age of ~9Y In captivity for ~7Y
17	Wild hatched	Died at DETROIT/H01944 at age of ~7Y In captivity for ~5Y
301	Wild hatched	Died at FRANKFURT/17723 at age of ~6Y In captivity for ~4Y, 10M
1	Wild hatched	Died at NY BRONX/_____ at age of ~5Y In captivity for 2Y, 8M, 11D
151	Wild hatched	Died at SAN ANTON/_____ at age of ~4Y In captivity for ~3Y
150	Wild hatched	Died at SAN ANTON/_____ at age of ~4Y In captivity for ~3Y
37	Wild hatched	Died at SD-WAP/016491 at age of ~4Y In captivity for ~3Y
15	Wild hatched	Died at DETROIT/H01943 at age of ~3Y In captivity for ~1Y
2	Wild hatched	Died at NY BRONX/_____ at age of ~3Y In captivity for 6M, 21D

## REPRODUCTIVE PARAMETERS ♂♂ MALE REPRODUCTIVE DATA

275 at NARC had baby 584 at age 2Y,10M,7D  
 264 at NARC had baby 450 at age 3Y,3M,23D  
 372 at NARC had baby 495 at age 3Y,5M,18D

Gestation Period: 23 days

T = 13.195      T = 13.108  
 Ro = 0.753      Ro = 0.652  
 lambda=0.98      lambda=0.97  
 r = -0.021      r = -0.033

30 day mortality: 18%  
 (70 deaths out of 387 arriving  
 within 30 days of birth date)

## 2013 International Studbook for the Kori Bustard *Ardeotis kori*

291 birth events to known age parents tabulated for Mx...

(Average of 326 births to female parents and 257 births to male parents.)

plus...

131 births to UNK or MULT sires...

62 births to UNK or MULT dams...

543 death events with known age tabulated for Qx...

WARNING: Values with small sample sizes (~N<30) warrant less confidence...

NOTE: Offspring of UNK or MULT parents have been proportionately factored into the fecundity.

# CENSUS REPORT

Stillbirths are included in both the Hatch and Death columns...

## GLOBAL POPULATION ANALYSIS

### **Demographic Summary:**

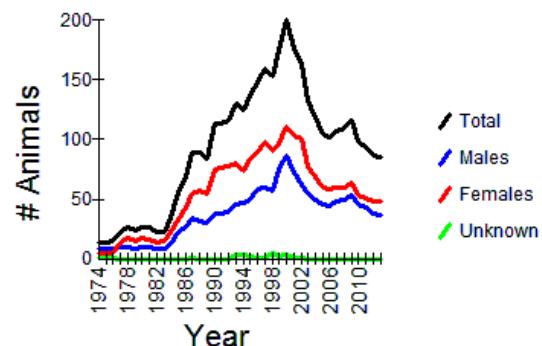

Current size of managed population	85 (37.48)
# Specimens excluded from management	0
Mean generation time	14.6 years
Potential population growth rate	0.979
# Births in past year	3
# Deaths in past year	7

### Demographic terms

*Generation length-* the average time elapsing from reproduction in one generation to the time the next generation reproduces. Also, the average age at which a male or female produces offspring. It is not age of first reproduction. Males and females may have different generation times.

*Population growth last year (lambda)-* the proportional change in population size from one year to the next. Lambda can be based on life-table calculations (the expected lambda) or from observed changes in population size from year to year. A lambda of 1.11 means a 11% per year increase; lambda of 0.97 means a 3% decline in size per year.

### **Genetic Summary:**

	Current	Potential
Founders	20	16 additional
Founder genome equivalents	7.41	30.47
Founder genome surviving	13.46	30.47
Gene diversity retained	0.933	0.984
Population mean kinship	0.068	0.016
Mean inbreeding	0	0.016
Ne / N	0.15	-----
% of pedigree known	84	-----

### Genetic terms

*Gene diversity-* The proportional gene diversity is the probability that two alleles from the same locus sampled at random from the population will not be identical by descent. Gene diversity is calculated from allele frequencies and is the heterozygosity expected in progeny produced by random mating

*Founder-* an individual obtained from a source population (often the wild) that has no known relationship to any individuals in the derived population (except for its own descendants)

*Inbreeding coefficient-* probability that the two alleles at a genetic locus are identical by descent from an ancestor common to both parents.

## 2013 International Studbook for the Kori Bustard Ardeotis kori

*Founder Genome Equivalent-* the number of wild caught individuals (founders) that would produce the same amount of gene diversity, as does the population under study

*Descendant population Mean Kinship-* The mean kinship coefficient between an animal and all animals (including itself) in the living, captive born population.

## KORI BUSTARD ETHOGRAM

From: Lichtenberg, E.M. and Hallager, S. 2007. A description of commonly observed behaviors for the kori bustard (*Ardeotis kori*). Journal of Ethology 26(10: 17-34.

<b>Behavior</b>	<b>Description</b>
<u>Resting behaviors</u>	
Alert	Bird sits on the ground or stands with its eyes open.
Resting	Bird sits or stands with its eyes closed.
Hock sitting	Bird sits with its tarsi on the ground and tibias vertical, leaving the belly raised off the ground.
Wet weather standing	During periods of light to heavy rain, bird tucks its head tightly against the back of its neck, giving it a hunched appearance. During poor weather, bird may stand under a bush for protection from the elements.
<u>Comfort/maintenance behaviors</u>	
Scratching	Bird scratches body (i.e., neck and head areas) using a toe.
Stretching	Bird stretches its leg, wing, or body, and typically involves stretching the wing and leg on the same side of the body. During a body stretch, neck is extended forward, body is lowered slightly, and wings are raised.
Wing flapping	Bird extends its wings and flaps them several times, often in conjunction with stretching or jumping.
Body fluffing	Bird briefly erects feathers on the neck, wings, and back.
Ruffling	Bird shakes its body, with movement passing as a wave from head to tail, which is usually slightly fanned.
Preening	Birds use their bill to straighten the feathers on their breast, neck, tail, legs, or wings. Preening is performed while sitting or standing, and the birds' eyes are often closed.
Toe picking	Bird uses bill to pull at a toe or nail, while standing on one leg.
Dust bathing	Bird lies flat and rubs its belly, head, neck, and wings on the ground, in a sandy or dusty depression. Feathers are ruffled during bathing.
Sun bathing	Bird sits in the direct sun (often near a bush or short grass clump) with one or both of its wings spread horizontal to the ground. Sun bathing

<b>Behavior</b>	<b>Description</b>
	often leads to heavy panting, and is always followed by preening.
Bill gaping	Bird briefly opens mouth wide.
Bill open	Bird partially opens bill for several seconds.
Panting	Bill is slightly open and the gular skin is moved back and forth. Panting is a cooling mechanism.
Tail erection	Birds raise their tails vertically and fan their tail feathers out. Tail erection occurs commonly after rain has ended, and may help in drying.
<b><u>Locomotion</u></b>	
Walking	Bird moves about on the ground at a leisurely pace (e.g., 1kmph). Walking is the primary mode of locomotion for kori bustards.
Running	Bird moves faster (at running human speed), with head held high and extended, or low and horizontal to the ground. Wings may be extended or held close to body. Running is used for avoiding predators.
Flying	Birds take off into the wind following a short run and wing flapping. Flying is also used for predator avoidance.
Jumping	Bird will jump into the air (up to 7 feet) without a running start. Jumping may be a means of evading terrestrial predators.
<b><u>Feeding behavior</u></b>	
Drinking	Birds drink while standing or hock sitting by submerging the beak in water, using tongue or throat motions to suck in water, and then raising the head to around a 45° angle to gulp down the water.
Foraging	Birds search for food while walking and looking down at the ground. Birds can also jump for food that is out of their reach.
Feeding	Birds peck at food within their reach or snap at jumping or flying prey with their bill. Larger vertebrates are shaken or struck against the ground before being swallowed whole; small items are just swallowed.
Grit eating	Birds peck at and ingest grit or small pebbles to aid in digestion.
Bill wiping	Bird rubs the sides of its bill along the ground, a tree trunk, or other object, to remove any debris attached to the bill.
Defecation	Fecal matter is excreted mainly while walking, or during short pauses,

<b>Behavior</b>	<b>Description</b>
	and typically when the bird wakes in the morning. Smaller amounts are excreted throughout the day. Defecation is also part of a fear response.
<b>Social behavior</b>	
Aggressive displacement	One bird chases another bird, by lowering its head, raising its head crest, ruffling its plumage slightly, and aiming its body towards it. Pursuit will often continue until the other bird it is out of sight.
Non-aggressive displacement	One bird walks toward another bird, causing the second bird to vacate its position and move elsewhere. Females do not displace adult males.
Fighting (males)	Birds grasp each other' beaks and shove each other, with feathers fluffed out and tails raised. May establish dominance during breeding.
Aggressive head pecking	A dominant bird pecks at the head of a subordinate bird for a short period of time, usually with no injuries.
Tail lifting	Sitting or standing bird lifts tail up to a 90° angle, fans out tail feathers, and then lowers the tail. Behavior may be repeated multiple times, and may be accompanied by erection of the head crest feathers. Occurs when birds approach. Males do not tail-lift to approaching females.
Threat posture	A standing bird lifts its tail and fans its tail feathers; its wings are outstretched, its plumage ruffled, and its head extended forward. The wings and tail may be vibrated.
<b>Inter-specific threat response</b>	
Skyward looking	Alert bird extends its head and cocks it upward, and may also tilt the head sideways so only one eye is facing upwards.
Crest up	Bird erects head crest feathers in response to a potential threat.
Neck fluffing	Bird erects neck feathers and head crest to increase its apparent size.
Tail spreading	Bird raises tail vertically and fans tail feathers as a defense posture against aerial predators.
Predator defense display	Bird crouches with its tail raised and fanned, wings loosely tucked to the body, and with its head and neck extended upwards in response to a potential or perceived predator flying overhead.
<b>Sexual behavior</b>	
Chasing females (males)	Males chase females with raised head crest and tail. Pursuit will often cease if females run away out of view.

<b>Behavior</b>	<b>Description</b>
Tail up position (males)	Males stands or walks with tail raised and fanned, wings held close to the body, and head crest erect, to attract the attention of females.
Partial balloon display (males)	Males stand with neck partially inflated, tail raised up, and head crest erect.
Balloon display (males)	Male extends neck and fully inflates the esophageal pouch (up to 4 times normal size) with the bill pointed upward. The tail and wing feathers point downward and the head crest is erect. Bird emits a low-pitched booming sound as bill is snapped open and shut. The balloon display is the most intense form of courtship.
Copulation initiation (females)	Female initiates copulation by sitting down near a displaying male to allow him to approach her from behind.
Head pecking (males)	Male approaches sitting female, and pecks (for 5-10 minutes) at the back of her head, stepping from one side of the female to the other.
Squatting and pecking (males)	Male squats on his hocks while continuing to peck at the female's head. This element of copulation generally lasts 5 minutes.
Mounting (males)	Male spreads wings, climbs onto the back of the seated female and transfers sperm (taking only a few seconds).
Post-copulation feather shaking	Males and females stand up after copulations and vigorously shake their feathers before resuming normal activities.
<b><u>Maternal behavior</u></b>	
Pacing (females)	The female walks back and forth in a particular area, faster than when just walking, for a few minutes or for several hours prior to egg-laying.
Incubating (females)	Females sit on eggs after first or subsequent eggs are laid. Incubating females rarely leave the nest, but will do so for behaviors such as feeding, dustbathing, and sunbathing.
Egg turning (females)	Females stand over the nest and rotate their eggs with their bills several times throughout the day and night.
Nest building (females)	Sitting female throws leaf litter and small sticks onto her back while incubating.
Parental care behavior (females)	Females in zoos are highly protective of the chicks and will act aggressively towards other females and keepers. Female will pick up food and present it to the chicks, bending her head and neck down while holding the food in her bill, and salivating copiously. The female

---

<b>Behavior</b>	<b>Description</b>
produces a quiet vocalization when feeding the chicks.	
<u>Vocalizations</u>	
Barking	Nervous or startled birds produce a soft, gruff “bark”, also called a “gronk” call. Barking birds typically stand, remain focused on the cause of concern, and may move away from this object.
Growling	A soft “rrrrrr” sound, similar to a cat’s growl. Females may growl when defending eggs or chicks, or when handled by keepers.
Booming (males)	A low-pitched booming vocalization produced by males in the breeding season when the bill is snapped open and shut. Males emit 6 calls in rapid succession, and may repeat the 6-call cycles for several minutes.
Chick chirp	A light chirp or purring sound produced by chicks being fed or brooded.
Chick cry	Stressed, chicks produce a long, sad whistle that can escalate into a loud wailing.
Grunting (females)	A low- to high-pitched sound produced by females to call their chicks, especially when food is available.
Roaring	A very loud vocalization similar to a lion’s roar, often occurring when birds are initially captured.

---

## BASIC BUSTARD HUSBANDRY

From: Baily, T., & Hallager, S. 2003. Management of Bustards in Captivity. Avicultural Magazine 109 (1): 1-8.

### Introduction

This article presents key facts for aviculturalists who are working with bustards maintained in either breeding projects or zoological collections. Further information on how to manage bustards in captivity may be found in the references at the end of this article.

### Bustards

The bustard family is made up of 25 species in 11 genera. Four species, including the great Indian bustard (*Ardeotis nigriceps*), are listed by the IUCN (International Union for Conservation of Nature and Natural Resources) Red List of Threatened Animals as Endangered. One species is listed as vulnerable and an additional six are listed as near-threatened (del Hoyo et al. 1996). Bustards are medium sized to large terrestrial birds, chiefly inhabiting open plains in either arid or seasonally dry regions of the old world. Agricultural changes, overgrazing, hunting, trapping, habitat loss, droughts and wars are the main threats to bustards (del Hoyo et al. 1996). In recent years, there has been a surge of interest in the propagation of bustards in captivity, in particular, the houbara bustard (*Chlamydotis undulata*) in the Middle East and North Africa (Saint Jalme and Van Heezik, 1996). Similar programs for vulnerable and threatened species of bustards such as the great bustard (*Otis tarda*) have been established in Europe and the former Soviet Union as well as for the kori bustard (*Ardeotis kori*) in the United States. Programmes with threatened bustard species aim to produce surplus birds for release into protected areas, thereby supplementing declining wild populations, while houbara bustard projects in the Middle East and N. Africa aim to provide surplus birds for sustainable hunting using falcons (Bailey et al, 1996). Captive breeding programmes in the United States for kori bustards and buff-crested bustards (*Eupodotis ruficrista*) aim to maintain populations that are genetically and demographically self-sustaining and do not rely on continued imports from the wild (Hallager and Ballou, 2001).

### Husbandry

**Housing** - Differences exist in the housing of bustards both between and within species and according to the region in which the birds are maintained in captivity. In the Middle East, captive houbara are managed in an extreme climate outside of their natural breeding range, and they are maintained in environmentally controlled buildings. In North Africa, where captive houbara are bred within their natural breeding range, birds are maintained in outdoor aviaries. In the United States, kori bustards are maintained in outdoor pens, which are equipped with heated shed areas, where the birds are housed in during periods of inclement winter weather. Smaller species such as the buff-crested bustard and white-bellied bustard (*Eupodotis senegalensis*) are kept in both indoor and outdoor aviaries and provided with supplemental heat during the winter months if housed outdoors and/or moved into winter holding facilities. The provision of shade and shelter are important for birds managed outdoors in tropical and temperate climates respectively, as is the use of predator-proof fencing material. All species of bustard are susceptible to frostbite and supplemental heat must be supplied when temperatures drop below

4°C. Outdoor aviaries may have alfalfa beds in addition to natural vegetation. This provides birds with cover to hide in and also encourages foraging for invertebrates attracted to the vegetation. Trauma is an important cause of morbidity and mortality of all captive bustards, so great attention is paid to using ‘soft’ materials when pens are constructed. Additionally, pinioning of chicks or feather cutting (primaries) of adults are important management tools to reduce the potential for self-inflicted injuries. Strict biosecurity of large captive breeding projects is an important issue. Smaller bustard species can be exhibited in mixed aviaries. Kori bustards should preferably be housed by themselves to facilitate breeding, but if necessary, can be maintained in mixed species exhibits with non-aggressive hoofstock.

**Diet and feeding** - Bustards are opportunistic omnivores and in the wild the diet reflects the local and seasonal abundance of plants and small animals, including invertebrates and small vertebrates. Studies of gut contents have shown that vegetation constitutes a significant proportion of the diet of some free-living bustards (del Hoyo et al. 1996). However, studies on the gut contents of kori bustards in Namibia have revealed mostly insects and very little plant material (T. Osborne, pers. communication). In captivity, bustards are fed mice, mealworms, crickets, apple, cabbage, chopped greens and either bustard pellets, game bird pellets, or a mixture of crane and ratite pellets (Sleigh and Samour, 1996). Beef mince can be used to replace mice or mealworms if either component is unavailable. Kori bustards in United States zoos are fed horsemeat in addition to mice and the meat is supplemented with either crane and ratite pellets or game bird pellets. The mixture is made into small meatballs and hand-tossed to each bird. This method of feeding facilitates close inspection of each bird as well as helps forming a trusting bond between the keeper and each bird. Pinkie mice are fed to smaller species of bustards, while fuzzie or adult mice are fed to the larger species such as kori bustards.

Calcium carbonate may be added to the fresh food mixture to compensate for the calcium imbalance that is caused by the addition of live food/mince. Multivitamin supplements (e.g. SA37; 1 g per 10 kg bodyweight) are provided to birds maintained in the Middle East (Sleigh and Samour, 1996). Maintenance pellets (15% protein) are fed to birds outside the breeding season and productioner pellets (20.5% protein) are fed during the breeding season (Anderson, 1998; Sleigh and Samour, 1996).

Food is presented in plastic or aluminium food dishes either once or twice a day. Water is provided ad-lib. Additional live food such as mealworms or crickets may be supplemented as part of taming protocols to reduce keeper-induced stress. To encourage natural foraging behavior, supplement the daily diet and provide a form of enrichment, chopped green beans, cherry tomatoes, hard-boiled egg, and blueberries are provided twice a week to kori bustards.

Medications may be given to specific birds within favoured items such as mice. Bustard chicks, like those of other long-legged species, are susceptible to long-bone disorders and chick-rearing diets must be supplemented with Vitamin D3 (e.g. Neutrobal, Vetark). Angel wing is a common occurrence in hand-reared kori bustard chicks, typically occurring at day 11-14. Taping the affected primaries in a natural position at the first sign of the outward turning will permanently correct the deformity. A definitive cause of the problem has not been determined (Boylan et al. 2001).

**Capture** - Correct methods must be used to catch and handle bustards to avoid injuries. For birds maintained in outside aviaries in the Middle East, as well as North American zoos in the southwest, catches are carried out early in the morning to reduce the risk of heat stress. In the

Middle East multivitamin solutions are given in the water before large catches to reduce the potential for capture-related myopathies. The specific methods for catching birds depend on the species, aviary size and the reason for the catch (translocation, medication, artificial insemination). Single small-medium sized birds in small outside aviaries are caught with catching nets. Single tame bustards in small indoor aviaries are caught by hand, after herding the bird into a corner. Flocks of birds in large aviaries can be captured using a catching corral. This is a blind-ended funnel with a wide mouth and a circular catching area at the blind end. Small and medium sized bustards can be caught using nets in the blind end, while larger species like kori bustards are caught by slowly guiding them into a small-darkened shed, cornering them and grabbing by hand. Nets should not be used with kori bustards.

**Handling** - Bustards should be held firmly against the handler's body, the wings should be fully closed and the legs held together, but prevented from rubbing against each other by positioning fingers between them. Legs can be held so that the legs are bent at the tibiotarsal joint. Some movement of the leg is allowed without letting the bird kick uncontrollably. Falcon hoods or cloth bags with holes for the nares can be used to calm birds down although hand-reared birds may be more comfortable without hoods. Birds should be kept as sternal as possible while being held as this reduces stress levels.

**Transportation** - Small bustards (up to 2 kg) can be transported in commercial pet carriers or cardboard boxes. Larger bustards, such as kori bustards can be transported individually in transport crates. Crate requirements for all bustard species can be found in the International Air Transport Association manual (IATA, 1998).

**Individual identification** - Bustards in captivity can be individually identified using coloured plastic rings with engraved coding attached above the tibiotarsal joint for visual identification of individuals in pens. Birds are also identifiable by means of a subcutaneous passive induced transponder (PIT), which is placed in the inner crural region of the leg.

**Routine health care** - Bustards in the Middle East have succumbed to variety of diseases, notably trichomoniasis, Newcastle disease and avian pox. Preventive medicine programmes include annual vaccination with inactivated Newcastle disease vaccine, live canary pox vaccine and regular (2-3 x year dependant on risk) anthelmintic and antiprotozoal medication given in the water or food. Vaccines are given during health-assessment catches held 1-2 months before the breeding season and during the cool season in the Middle East. Within the United States, internal parasites are occasionally seen and avian pox has been reported in two chicks. Vaccines are not routinely administered in the United States. Kori bustards in zoo settings need to be carefully monitored for signs of impaction and zinc toxicity as they have a particular tendency to consume items thrown into their enclosures (e.g. pennies, camera batteries, nails, etc) by visitors. Daily inspection of pens and the removal of foreign material are very important.

## Breeding Management

**Sexing.** - Bustards show sexual dimorphism (Table 1). Some smaller species such as white-bellied bustards can be sexed by differences in head and throat plumage. Larger species, e.g. kori, are easily sexed at one year of age, for although the plumage of both sexes is similar, males

are considerably larger. Juvenile bustards can also be sexed using endoscopy after about 6 months of age. Genetic sexing offers many advantages, being non-invasive and if done from feathers or blood collected from freshly hatched chicks, it can allow different sexes to be reared under different protocols.

Table 1. Adult bodyweight of bustards.

Species	♂ (kg)	♀ (kg)
Great bustard ( <i>Otis tarda</i> )	6-8.5	3.8-4.5
Kori bustard ( <i>Ardeotis kori struthinuculus</i> ) <sup>1</sup>	10-18	6-7
Kori bustard ( <i>Ardeotis kori kori</i> ) <sup>2</sup>	7-14	3-6
Houbara bustard ( <i>Chlamydotis undulata</i> )	1.5-2.5	0.8-1.4
White-bellied bustard ( <i>Eupodotis senegalensis</i> )	1.0-1.3	0.9-1.1
Buff-crested bustard ( <i>Eupodotis gindiana</i> )	0.4-0.8	0.4-0.6

**Breeding strategies** - Bustards are K-selected species - long-lived and a low reproductive output (del Hoyo et al. 1996). Management strategies for breeding vary according to the species but there are basically three regimes (Table 2). In most species, males and females do not establish a true pair-bond, and depend instead on a dispersed lek breeding system in which the males advertise themselves in traditional areas. Male bustards perform elaborate displays to attract females and maintain a dominance hierarchy. The females are left alone to undertake nesting, incubation, and rearing of the young. In captivity, houbara bustards managed as pairs or as mixed sex groups rarely, if ever, breed. Similarly, houbara bustards caught as adults remain sensitive to stress and in most cases fail to breed. Successful houbara bustard breeding projects use hand-reared birds, which are more suitable for intensive production efforts utilizing artificial insemination. White-bellied bustards are monogamous and adults are maintained in pairs. Kori bustards are managed in mixed-sex flocks, but can be managed as trios. Intra-specific aggression can occur between buff-crested pairs (♂-♀) and male koris (♂-♂) in the breeding season so care needs to be taken when there are changes to group structure. Adult male kori's may require physical and visual separation during the breeding season to prevent aggression and physical injuries (Boylan et al. 2001).

Table 2. Examples of breeding strategies.

Strategy	Species	Age	Social Grouping
Isolated for artificial insemination	Houbara	Adult	Singles
		Juvenile	Small groups ( $\leq 5$ )
Pairs	White-bellied	Adult	Pairs
		Juvenile	Small groups ( $\leq 5$ )
Heterosexual groups	Kori	Adult	Large group (~25)
		Adult	Trio or 2.3
		Juvenile	Large group (~15)

### End-piece

Species such as houbara are in the early stages of ‘domestication’, as the objective is to produce large numbers of birds for managed hunting. Other species, e.g. great bustard and kori bustard, are maintained in captivity for conservation objectives. Productivity of all species in captivity is held back because of a poor understanding of nutritional requirements and high levels of breeder infertility and chick mortality. An expansion of the knowledge base for bustards is needed if advances in the husbandry and medical management of these birds are to be made.
