Introduction

The regional studbook for pied tamarins (*Saguinus bicolor*) is a subset of the international studbook. This version is current through 1 September 2012 for the US and Canada (temporary numbers only assigned to 2012 births), current through 31 December 2011 for European institutions, and current through 1 August 2009 for Brazilian institutions.

Biological Information

Taxonomy

The genus *Saguinus* (Hoffmannsegg 1807) belongs to the primate family Callitrichidae. Historically, three subspecies of *S. bicolor* have been described (Hershkovitz 1977; Rylands *et al.* 1993):

Saguinus bicolor bicolor Spix 1823

S. b. martinsi Thomas 1912

S. b. ochraceus Hershkovitz 1966

However, a recent assessment (Rylands *et al.* 2000; Groves 2001) described *S. b. bicolor* as a monotypic species *S. bicolor* and placed *martinsi* and *ochraceus* as the two subspecies within a separate species *S. martinsi*.

Several common and scientific names have been used in reference to this species. Common names used include pied tamarin, bicolored tamarin, bare-faced tamarin, Brazilian bare-faced tamarin, pied marmoset, and pied bare-face tamarin. Former names for the genus *Saguinus* include *Tamarin* Gray 1870 and *Leontocebus* Wagner 1840.

Hershkovitz (1977) divided the genus *Saguinus* into the following "Sections", based primarily on pelage: hairy-face, mottled-face, and bare-face tamarins. Each Section is further subdivided into "Groups". *S. bicolor* (Brazilian bare-face tamarins) and *S. oedipus* (Colombian and Panamanian bare-face tamarins) are the two Groups within the bare-face tamarin Section. More recently, Natori and Hanihara (1992) placed the *S. midas* group within the bare-face tamarin Section as well.

Distribution

S. bicolor is endemic to Brazil. *S. bicolor* is found in the vicinity of Manaus, the capital of the state of Amazonas. Surveys by Ayres *et al.* (1980, 1982) showed that the range extends only ~30-45 km north of Manaus and east as far as the town of Itacoatiara (~100 km from Manaus). Recent work by Subirá (1998) suggests a current distribution that "extends from the Rio Negro, as far north as the left bank tributary, the Rio Cuieiras, east to the Rio Urubú, and only as far north as Km 35 on the BR174 highway." The total geographic range was estimated at 7,500 square kilometers (Subirá 1998). Rylands (1993) shows a distribution map.

The range of *S. midas* overlaps that of *S. bicolor*. Historically, the two species had not been recorded from the same site (Hershkovitz 1977), but there is recent evidence of *midas* within the Adolfo Ducke Reserve, the largest protected areas containing *bicolor* (R. Subirá, unpublished data). The two species have interbred in captivity (Immendorf 1961 in Hershkovitz 1977), but there are no published data available concerning their interspecific relationship in the wild.

Physical characteristics

Distinguishing characteristics include the black hairless face and ears. The skin of the face is sometimes mottled. Ears are large. Tail is bicolored, usually blackish to pale brown above,

reddish to orange below. As for other marmosets and tamarins, there is little or no sexual dimorphism in size and weight. Following are some physical measurements:

Head and body length:	208-283 mm (Hershkovitz 1977)
Tail length:	335-420 mm (Hershkovitz 1977)
Weight:	430 g (adult) ¹ (Ford 1994)

More specific physical description follows (Hershkovitz 1977; Emmons 1990):

White forequarters, sharply defined from the pale brown back and hindquarters; tail black above, rust-gold below; throat and chest white; belly brown mixed with buff; inner thighs and lower abdomen bright rust-red. This pied coloration is unique among bare-face tamarins. The head of newborn and very young *S. b. bicolor* is like that of the adult except that the cheeks, forehead and crown are covered with white hair.

Habitat

S. bicolor is found in secondary lowland rainforest, swamps, forest edges (Hershkovitz 1977; Wolfheim 1983; Emmons 1990), and white sand forest (Egler 1992). Climate in the geographic distribution is humid, with temperatures high and relatively uniform throughout the year (Egler 1992), but with seasonal variation in rainfall.

Diet

The diet consists primarily of fruit but also includes gum, arthropods (insects and spiders), and flowers (Stevenson and Rylands 1988; Egler 1992). For Egler's (1992) study group, fruit made up ~96% of the diet and the animals ate fruits that were small, ripe and succulent. Gums were exploited during the dry season and the beginning of the wet season and were eaten opportunistically as they flowed from holes in trees. Three fruit species were eaten as the regular food supply, each species for an extended, non-overlapping period. Of the 21 fruit species eaten, nearly 2/3 were berries and pods.

Reproductive parameters

Cycle length:	~3 weeks ² (Heistermann 1987)
Gestation length:	~160 days ³ (Heistermann 1987); >185 days (studbook)
Birth interval:	6-6.5 months (Hershkovitz 1977; Egler 1992); 194-220 days (sampling from studbook)
Seasonality:	births in May and November (wild animals: Egler 1992)
No. of offspring:	1-3 (Egler 1992; studbook records)

Social structure

¹ Note: Many weights on adult captives are higher than this, ranging up to 550g or above for non-pregnant adults.

² A preliminary finding, based on one study, but this data compares well with that available for other callitrichids.

³ The 160-day gestation estimate is based on a single study. A review of interbirth intervals from the studbook indicates that the gestation period may be substantially longer. A sampling of 17 interbirth intervals from four *bicolor* pairs ranged from 194-226 days. This suggests a gestation period closer to that of *Saguinus oedipus*, 185-195 days.

The animals seem to live in small family groups of 2-10 individuals (Emmons 1990; Egler 1992). A wild group studied for eleven months by Egler (1992) had 6-10 individuals, mostly of unknown age and sex. There are no data suggesting major differences between this taxon and other *Saguinus*.

Behavior

Very little behavioral information is available. There are few studies of *S. bicolor* in captivity, and there has been only one published long-term field study (Egler 1992), although additional field work has been completed by Rosana Subirá (Subirá 1998, Subirá unpublished M.S. thesis).

Pied tamarins are diurnal and arboreal. The species makes birdlike chirps and whistles (Emmons 1990), and their long calls, along with those of *S. oedipus* and *S. geoffroyi*, are the only callitrichid long calls that consist of 2 or 3 very long syllables with little or no frequency modulation (Snowdon 1993). Locomotion is quadrupedal, with some clinging and leaping (Hershkovitz 1977). Five types of scent-marking behavior have been observed, including 2 types that are unusual for callitrichids (Wormell and Feistner 1992).

One unusual characteristic noted from captive groups (Wormell et al. 1996) is the tendency for births to occur in the afternoon, rather than after dark as is considered typical for other callitrichids.

In Egler's field study (1992), a group of 6-10 animals living in an area of secondary forest in a suburb of Manaus was the focus of an 11-month project on habitat and dietary requirements. This group fed in low trees with small crown diameters, and group travel was based on routes connecting the fruiting trees exploited, with foraging for animal prey occurring during travel. Although most of the food consumed was fruit, most of the foraging time was devoted to searching for and capturing arthropods. A home range size of 12 ha was found.

Status in the wild

Saguinus bicolor has one of the smallest geographic ranges, and is possibly the most endangered of the Amazonian primates (Ayres et al. 1982; Emmons 1990; Egler 1992, 1993). In general, this taxon is scattered throughout the suburbs of and areas surrounding the city of Manaus, an area densely inhabited by humans and rapidly growing. Urban expansion, cattle ranching and agriculture all contribute to habitat loss for this taxon (Egler 1993). *S. bicolor* does (or at least did) occur in four protected areas (Egler 1993): the Adolfo Ducke Reserve of the Instituto Nacional de Pesquisas da Amazônia (INPA) (10,000 ha), the Alberto Egler Reserve of INPA (630 ha), the Ecological Reserve of Sauim-Castanheiras (109 ha) under the jurisdiction of IBAMA, and a small private reserve of the Tropical Hotel in Manaus.

Ayres et al. (1980, 1982) suggest that *S. bicolor* is gradually being replaced by *S. midas midas* populations, either naturally or as a result of human activity. Hershkovitz (1977) suggests that *S. bicolor*'s restricted geographic range, which is much smaller than that of *S. m. midas*, may be due either to a geographic accident or to mutual exclusion. More recent work by Subirá (1998) indicates that *S. m. midas* has expanded its range since the early 1980's, as indicated by investigation at 173 sites visited in an effort to define the current range of *S. bicolor*. Subirá suggests that displacement by *S. midas* may be a greater threat to *S. bicolor* than the expansion of the city of Manaus.

Currently *S. bicolor* is classified as follows:

CITES Appendix I
USESA Endangered
2012 IUCN Red List of Threatened Animals – Endangered (Mittermeier et al. 2008)
2008 List of Brazilian Fauna Threatened with Extinction
